

November 2023

CASCADE-PC was developed with VA Smalltalk as a front-end application for the CASCADE mainframe clearing and settlement system.

The CASCADE-PC version 10.5 will be available in production as of Monday, 20th November 2023. This release was defined mandatory, i.e.:

CASCADE-PC users need to work with the CASCADE-PC version 10.4 until close of business on Friday, 17th November 2023. Please note, that the version 10.5 will not be up and running at this time. Version 10.5 has to be used starting on Monday, 20th November 2023. At the same time, version 10.4 will be disabled.

In addition to the CASCADE-PC software, a terminal emulation is required for proper operation of the system. CASCADE-PC communicates with the mainframe host of Deutsche Boerse through IBM3270 data stream via a HLLAPI interface of the terminal emulation. You can find further information in the installation manual. The installation and/ or update of the CASCADE-PC software, as well as the configuration of the connection with the terminal emulation (IBM or Open Text) are described in the installation manual.

The installation procedures of CASCADE-PC comply with the usual standards. Please consider the hardware and software requirements described in the manual before starting the installation. Parallel installations of various versions of CASCADE-PC are also possible as part of the standard installation. The directory path entries for a parallel client/ server installation must be adjusted accordingly.
